

Definition of “Done” for a Product Backlog item was created by the Product Owner and accepted by all team members:

A user story is “Done” when it is ready for release. The user story needs to be fully implemented, documented and tested by all subgroups involved in the User Story development. The analysis and design of the User Story must be checked in order to see if the implementation and testing methods match the decided tasks and fulfill customer’s requests. All tests must be passed in order to declare the Story as “ready to be released”. If development team decides to implement unit testing for the selected item, tests must pass in all conditions and must be proven to the Scrum Master. Code must be reviewed in order to be clean and to contain code documentation where it is needed in order to explain complex algorithms and methods. Non – functional requirements must be met.

Documentation and code folder must be reviewed to contain all updated versions of the produced resources. All changes must be pushed to the GitHub repository master branch without causing conflicts. Finally, Product Owner must accept the User Story and mark it as “Completed” in the Product Backlog.
